4.2 External Groups

[Internet Engineering Task Force](#)

The XML Signature specification was produced in a joint effort between W3C and the IETF. It is expected that the XML Security Working Group will liaise closely with the IETF Security and Application Areas in developing its deliverables.

[OASIS](#)

A number of OASIS Technical Committees in the security area are direct users of the core XML security specifications, and are possible sources of use cases and requirements for this work. The Working Group should solicit these Technical Committees to review its deliverables. Such Technical Committees include:

- [Digital Signature Services eXtended \(DSS-X\)](#)
- [eXtensible Access Control Markup Language \(XACML\) TC](#)
- [Security Services Technical Committee \(SSTC\)](#)
- [Web Services Federation \(WSFED\) TC](#)
- [Web Services Secure Exchange \(WS-SX\)](#)

Other OASIS Technical Committees that make use of the XML security specifications include the [Web Services Transaction \(WS-TX\) TC](#), the [Election and Voter Services TC](#), the [Universal Business Language \(UBL\) TC](#), and the [LegalXML Electronic Court Filing TC](#).

[ETSI Electronic Signatures and Infrastructures \(ESI\) Technical Committee](#)

The ETSI Electronic Signatures and Infrastructures (ESI) Technical Committee is the lead body within ETSI in relation to the standardization activities dealing with Electronic Signatures and related Infrastructures within ETSI.

[Web Services Interoperability Organization](#)

The Web Services Interoperability Organization (WS-I) Basic Security Profile (BSP) work group is chartered to profile Web Services Security (WSS) for interoperability. Web Services Security is a user of XML Signature and XML Encryption. The Working Group is expected to inform WS-I BSP on proposals for future work.

[Liberty Alliance](#)

The Liberty Alliance has developed an identity web services framework (ID-WSF). This community is familiar with and uses XML Security and should be consulted in developing proposals for further work.

Q. Widget engine

From Wikipedia, the free encyclopedia

In computer software, a **widget engine** is a software service available to users for running and displaying **desktop widgets** on the [desktop](#). Desktop widgets are physically inspired [applets](#) that give access to information and frequently used functions such as clocks, calendars, news aggregators, etc.

The term widget engine is not to be confused with that of a [widget toolkit](#). Toolkits are destined to [GUI](#) programmers, who combine several widgets to form a single application. A widget in a toolkit provide a single, low level interaction, and is prepared to communicate with other widgets in the toolkit. On the other hand, widget engines are intended for end users and each desktop widget is a stand-alone, task-oriented application which can be composed of several related interactions on its own.

The desktop widget model is attractive because of ease of development. Most of these widgets can be created with a few images and about 10 to several hundred lines of [XML/JavaScript/VBScript source code](#). A single host software system, [such as a web browser](#), runs all the loaded widgets. This allows several desktop widgets to be built sharing resources and code.

Widget engine

From Wikipedia, the free encyclopedia

In computer software, a **widget engine** is a software service available to users for creating **desktop widgets** on the [desktop](#). Desktop widgets are physically inserted into the desktop that give access to frequently used functions such as clocks, calendars, news aggregators, and frequently used functions such as clocks, calendars, news aggregators.

The term widget engine is not to be confused with that of a [framework](#). Frameworks are designed for programmers, who combine several widgets to form a single application. A widget engine provides a single point of interaction, and is prepared to communicate with other widgets in the tool. The widget engine is intended for end users and each desktop widget is a stand-alone, task-oriented application. The widget engine is composed of several related interactions on its own.

The desktop widget model is attractive to developers because these widgets can be created with a few images and about 10 to several hundred lines of [HTML/JavaScript](#) [source code](#). A single host software system, [such as a web browser](#), provides the look and feel for the widgets. This allows multiple desktop widgets to be built sharing resources and code.
